# SolGrader

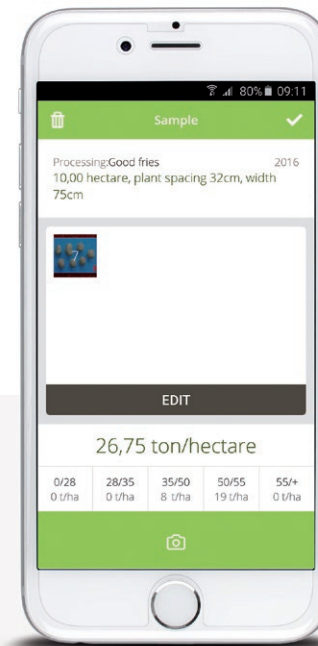

The **very fast** and most **easy way** to  
**calculate the yield** on a **potato field**

Potato growers need to make a lot of decisions during the growing season. For example tuber size and yield per hectare are indicators on which the decision for haulm killing is made.

How easy would it be, if you can take a photo of the potatoes and you receive the necessary information immediately!

**SolGrader**

**SolGrader** is the first real time information application for potato growers and potato collectors. It's user friendly and based on advanced technology to make reliable calculations.

The SolGrader app makes analysis of the yield much easier. Simply take a photo of the potatoes and the app immediately tells you:

- the tuber sizes
- the tuber weight
- the estimated yield/hectare

**How it works** Add some basic information, such as variety, acreage, planting distance and row width. Use your smartphone to take a photo of the tubers on the blue mat and the app will give you the results immediately. Repeat the process on a few other locations in the field for an even better reliability. Contact our office for availability of the blue mat.

Available in:

App Store

Google play

Windows Phone
